LeadAnchor — What You Need to Build

A plain-English summary of the two files from your manager: "LeadAnchor_Specs Doc.pdf" and "Revenue_Automation_OS_Capabilities v2.xlsx".

1. The big picture

The product is a multi-tenant SaaS for tiny US service businesses. It is called LeadAnchor (or "Revenue Automation OS" in the Excel). Think plumbers, electricians, HVAC, salons and groomers: one to five people, owner-run, non-technical, always on a phone.

The problem it solves: these owners miss calls while they work. Every missed call is lost money.

What the platform does:

1. It catches the missed call.
2. It texts the caller a link, or an AI answers with one quick question.
3. The lead lands on a simple board in the owner's phone.
4. The owner quotes the job, collects a deposit, books it, and follows up.
5. A dashboard shows "money recovered", so the owner sees why they pay.

It is sold as a cheap monthly subscription: Starter $45, Pro $105, Growth $199.

2. What each file is

The PDF is a scope brief written for outside development partners. It says what to build at module level and asks them for estimates. Detail is "withheld until NDA".

The Excel is the detailed spec. It has 52 capabilities (C-01 to C-52), and each one has:

- a plain-English owner benefit,
- a developer build spec with acceptance tests,
- the systems it needs,
- legal flags and dependencies,
- which phase and pricing tier it belongs to.

It also has a phase roadmap, a vendor list, a glossary, and a legal review guide.

How they fit: the PDF is the summary and the Excel is the detail. The Excel's "Pilot" has 14 items, which roughly matches the PDF's "Phase 1 ~14 features".

3. The 14 modules (from the PDF)

#	Module	What it means
1	Telephony	A dedicated phone number per customer business (tenant). It catches inbound calls and branches on call state.
2	Voice AI	A short AI phone greeting (max 60 seconds) that asks one question.

3	Intake and media	Mobile forms, photo upload, and AI that reads the photo (brand and model).
4	Work management	A Kanban lead board, customer history, and tags.
5	Messaging	SMS, RCS, WhatsApp and email, all sent through one controlled "send path".
6	Documents and quotes	AI drafts a quote from a photo plus the owner's price list. The owner must approve it before it goes out.
7	Payments	Stripe checkout, deposits, and pay links.
8	Scheduling	Two-way calendar sync, self-booking, reminders, and no-show handling.
9	Listings	Two-way sync with Google Business Profile, including reviews.
10	Reporting	Fixed reports and a headline dashboard. No custom BI.
11	Outbound campaigns	Win-backs, promotions, and weather-triggered offers.
12	Recurring billing	The owner sells their own monthly maintenance plans to their customers.
13	Compliance	Consent records, an audit trail, and automatic carrier registration for each tenant.
14	Operator console	An internal admin tool for onboarding, support, and monitoring.

There is also a light public web presence: a marketing site and a generated page per tenant. It is not a CMS.

4. The phases

PDF phase	What it covers	Size
0	Foundations: architecture, multi-tenancy, auth, CI/CD, the send path, audit logs	—
1	Core capture loop (modules 1, 2, 3, 4 partly, 13 registration). This is the "sellable minimum".	~14 features
2	Workflow and money (modules 4, 6, 7, 8, 9, 10). This is the largest phase.	~15
3	Growth features and inter-tenant lead passing	~7
4	Campaigns and recurring billing	~11
5	Future ideas (portals, marketplace). Excluded.	~4

The Excel names its phases differently: Pilot, Pilot+MVP1, MVP1, MVP2, Phase 2. The two roughly line up, but they are not identical. Ask your manager which naming to use.

5. Why this is hard (what the PDF warns about)

High complexity:

1. **Real-time call handling.** A call branches in the first seconds, and this runs on webhooks. Duplicate, late, or out-of-order events must not break it.
2. **Low-latency voice AI.** The delay must stay under about one second, using streaming speech-to-text, an LLM, and text-to-speech.
3. **Carrier registration at scale (10DLC).** Every tenant needs its own registration with US carriers. It takes 1–4 weeks, and it must be automated through the API. There are two paths: one for businesses with an EIN, and a sole-proprietor path with OTP verification. The PDF says people underestimate this.
4. **Compliance engine.** Consent must be recorded, versioned, checked at send time, and revocable within 10 business days. It needs a tamper-proof audit log.

Medium complexity:

- One governed send path for four channels. Feature code must never send a message directly.
- Per-tenant provisioning and removal (phone number, Stripe sub-account, Google account, registration).
- Stripe billing sync.
- Calendar sync, with recurrence and timezone problems.

Lower complexity, but a high quality bar: the owner UI must be simple and mobile-first, not "enterprise software".

6. Rules baked into the product

- **No SMS before carrier approval.** Until then, day-1 links go by WhatsApp or web.
- **Email-first marketing.** SMS marketing waits for legal sign-off (TCPA).
- **AI never sends anything unapproved.** Quotes and review replies need the owner's tap.
- **Never use the word "Verified".** Licence and insurance details are self-attested, so the label is "Licensed & Insured".
- **No review gating or incentives.** Every completed job gets both the Google review link and a private-feedback link.
- **No card data on our servers.** Stripe-hosted pages only.
- **Provider abstraction.** Telnyx, the AI vendor, and others must be swappable without touching business logic.
- **Non-functional needs:** mobile-first; high availability on the call-capture path; pages load in under 2 seconds; encrypted PII; English and Spanish ready, US only; tracing and alerting from day one.

7. Integrations needed

- Telnyx (calls, SMS, 10DLC) or an equivalent
- WhatsApp via a BSP

- Rich messaging (RCS)
- Transactional email
- Stripe Connect and Billing
- Calendar (Google and Outlook per the PDF; Calendly/Jobber/Acuity per the Excel)
- Google Business Profile
- AI services (speech-to-text, text-to-speech, vision, LLM)
- Push notifications

8. Out of scope

- Native mobile apps (responsive web only)
- A CMS or page builder
- Accounting integration
- BI or data warehouse
- Markets outside the US
- Anything in Phase 5

9. What the PDF asks the builder to deliver

Section 8 of the PDF is the key part. It does not ask for code. It asks for a **proposal**:

1. Cost and time ranges per phase, with assumptions.
2. Team shape (roles, seniority, dedicated or shared).
3. Recommended tech stack and why.
4. Relevant experience (telephony/CPaaS, Stripe marketplace, compliance platforms).
5. How you would de-risk the two high-complexity third-party items (the PDF says "two" but lists four; they most likely mean carrier registration and the real-time voice/call path).
6. Anything you would push back on or sequence differently.

Contract terms: the client owns all IP and the repo from the first commit. They prefer phased contracts, firm on Phases 0–1 and a rate card for the rest. A technical cofounder is the contact for architecture talks.

10. Things to confirm with your manager

1. **What is "build" right now?** The PDF reads like a request for an estimate and plan, not the full build. Is that your deliverable first, or are you starting Phase 0/1?
2. **Which phase?** Probably Phase 0 plus 1 first.
3. **Calendar mismatch:** the PDF says Google and Outlook sync. The Excel says third-party schedulers (Calendly, Jobber, Acuity).
4. **Phase naming mismatch:** Pilot/MVP1/MVP2 versus Phase 0–5.
5. **Stack:** the PDF says "no strong preference", so the choice is yours.
6. **The two "high-complexity" items** the PDF says to de-risk.
7. **Legal items** (the Excel's Legal Review Guide): do you build around them with flags, or wait for

counsel?
